PRACTICAL-11

AIM: Create a student management module with MySQLi prepared statements: add, view, edit, delete, search and filter student records, with clear success and failure messages.

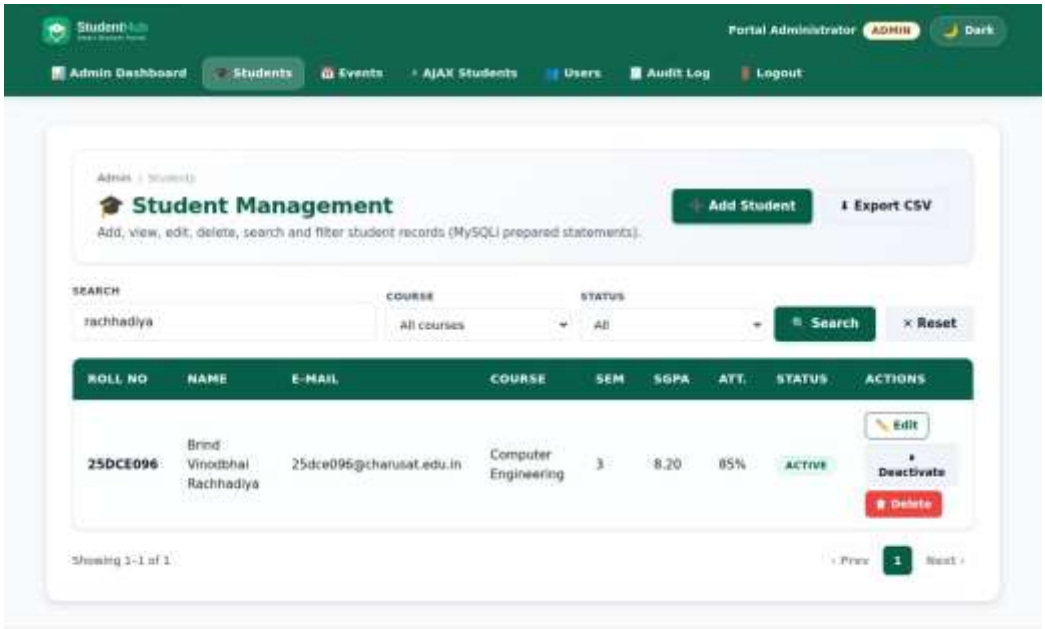

SOURCE CODE :

https://github.com/rachhadiyabrind-del/WDF_B/tree/main/Practical(1-4)(Studenthub)/Practical-11

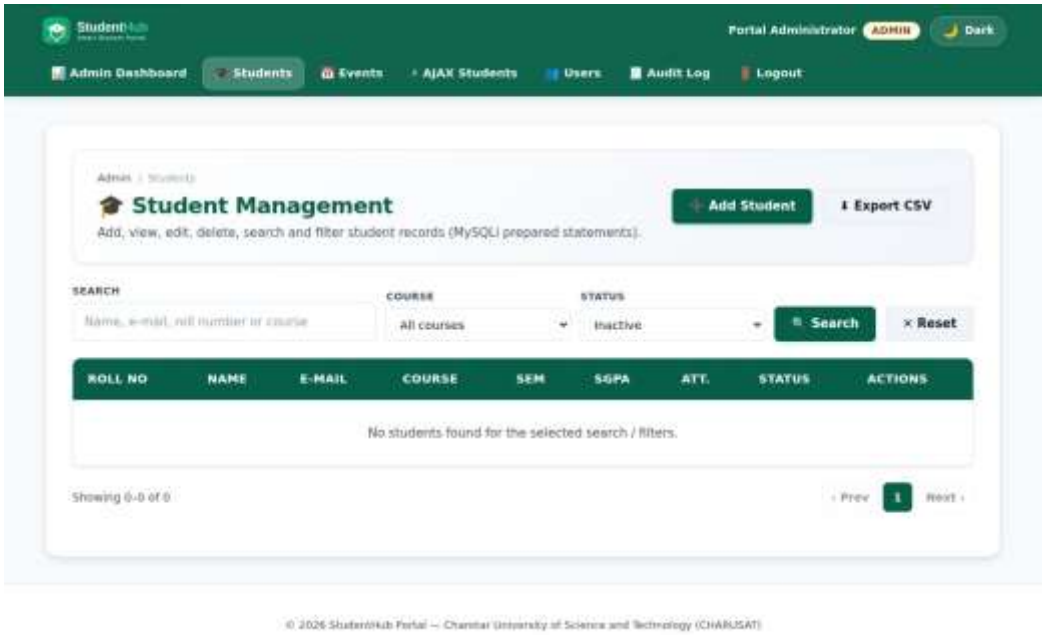

PREVIEW:

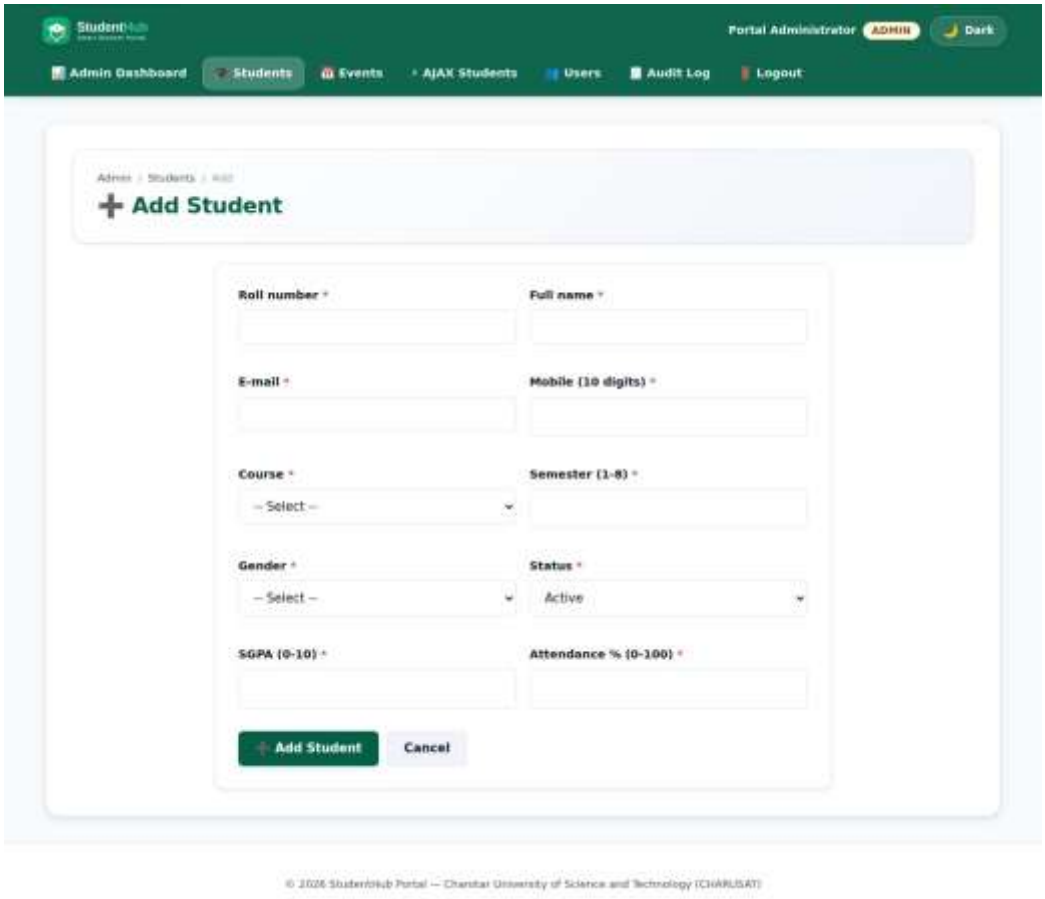

Student list with pagination and status badges

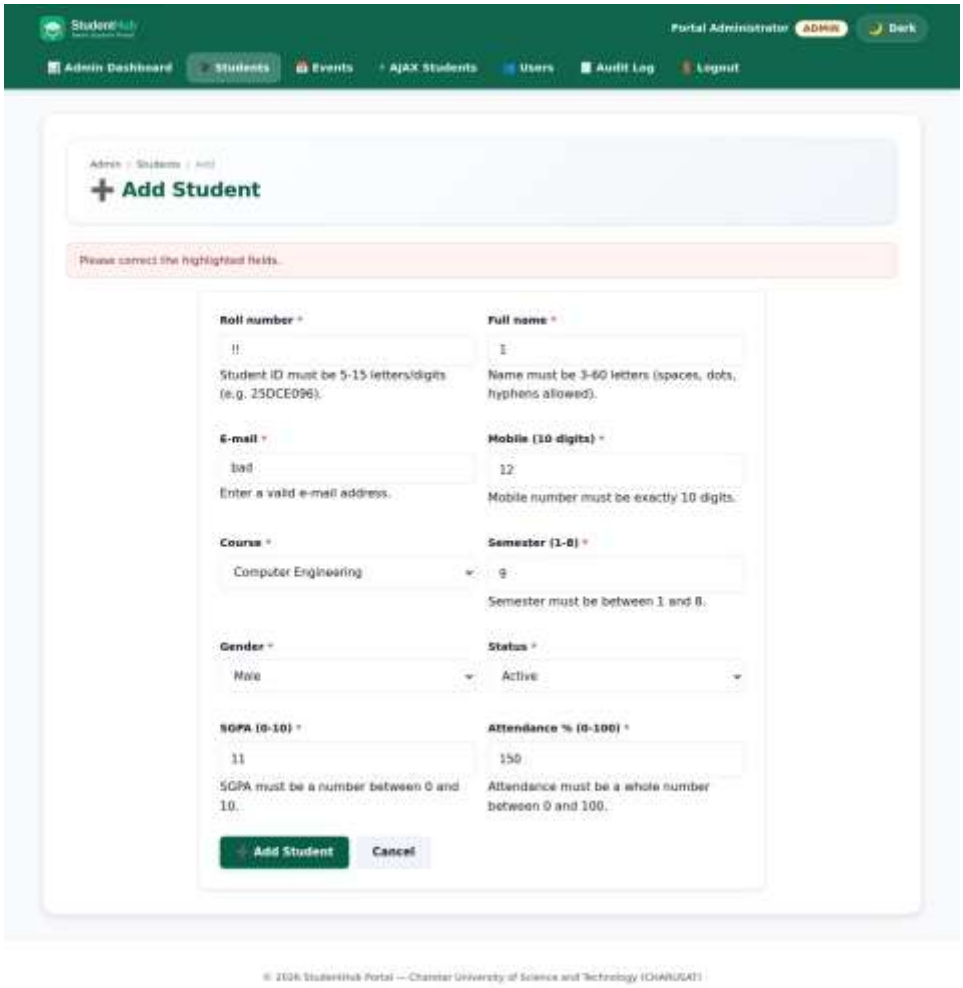

Search "rachhadiya"

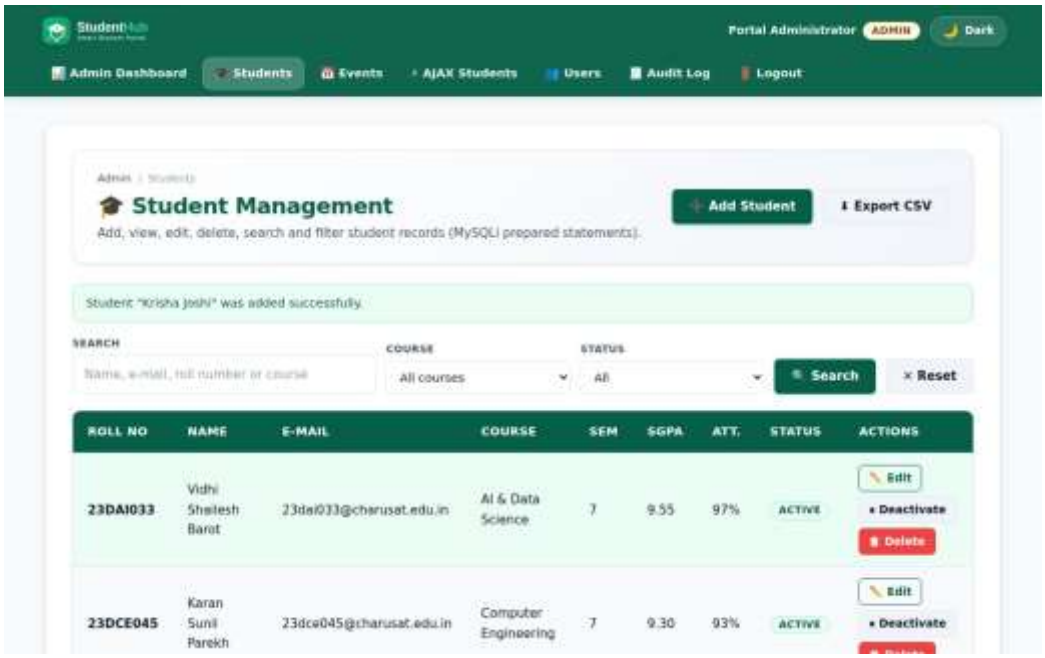

Filter: status = Inactive

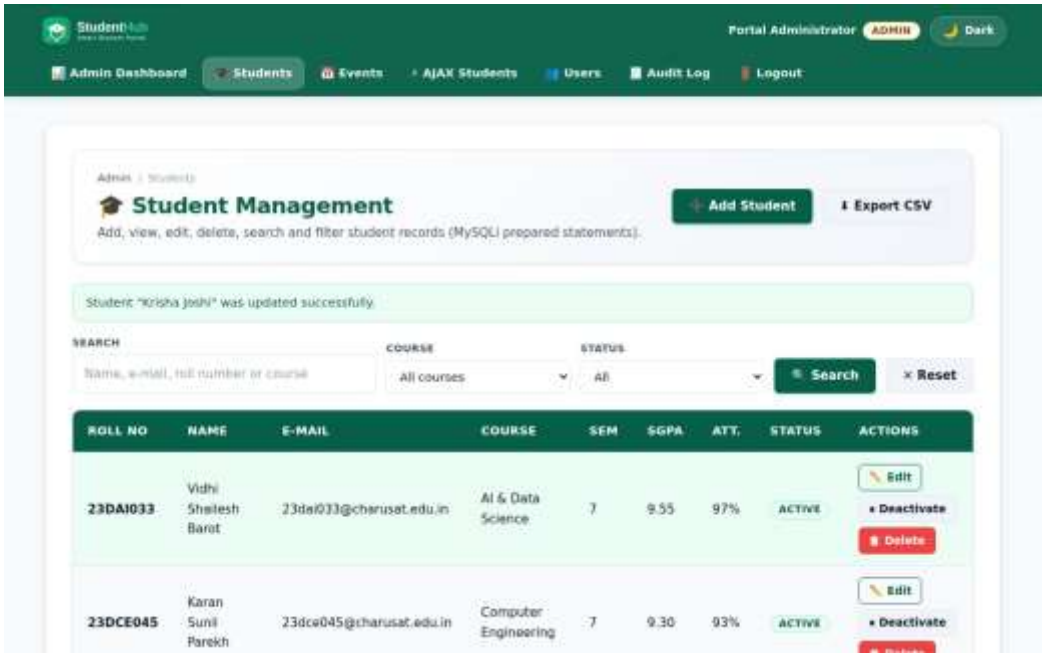

Add student form

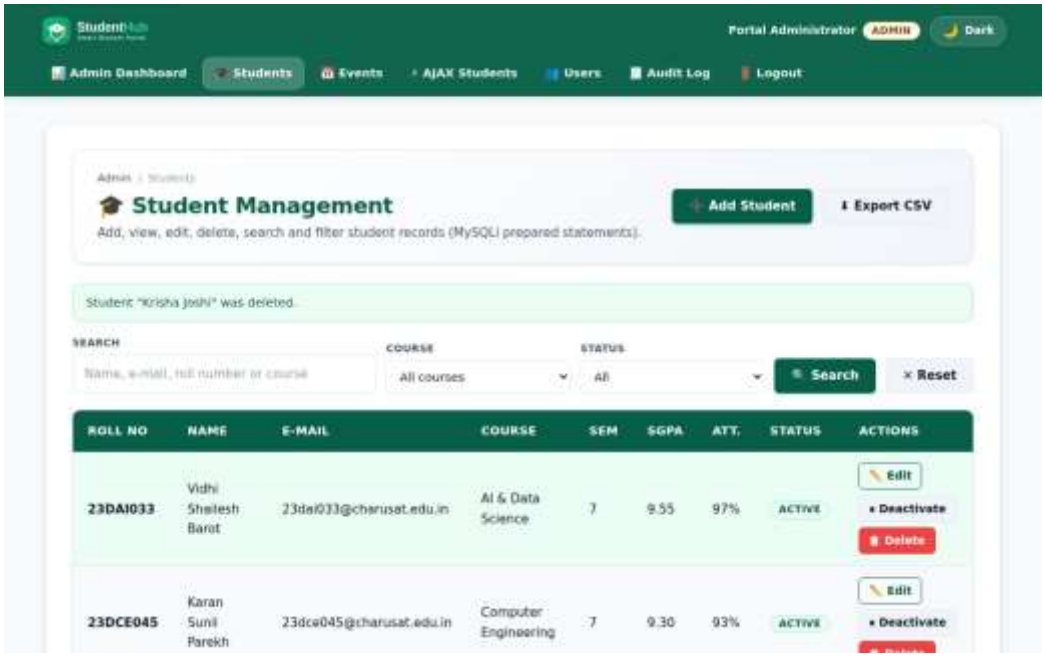

Validation errors on the add form

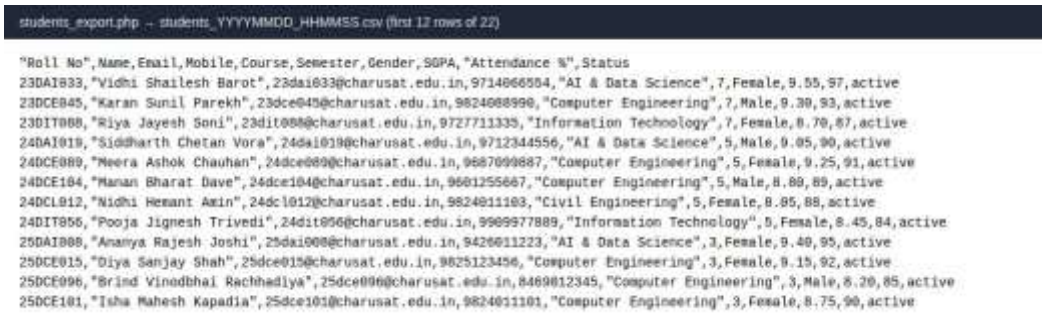

Student added - success message

Student updated - success message

Student deleted after the confirmation dialog

Student list exported to CSV

TEST CASES :

#	Input / action	Expected result	Result
1	Open the student list	22 seeded records shown in pages; status badge on each row	Pass
2	Search for "patel"	Only students whose name, e-mail, roll number or course matches are shown	Pass
3	Filter by status = Inactive	Only inactive students shown; combines with search	Pass
4	Submit the add form with blank or invalid fields	Field-level error messages; no insert	Pass
5	Add a valid new student	Success message; record appears in the list	Pass
6	Edit an existing student and save	Success message; changed values shown	Pass
7	Delete a student	Confirmation dialog first; after OK the row is removed and registrations are cascaded	Pass
8	Deactivate and reactivate a student	Status changes; the row is kept (soft delete)	Pass
9	Export the filtered list to CSV	CSV downloads with the filtered rows and the header row	Pass

KEY QUESTIONS :

1. Are SELECT, INSERT, UPDATE and DELETE operations working?

Yes. students_list.php runs the SELECT (with a COUNT for pagination), student_form.php runs the INSERT for new students and the UPDATE for existing ones, and student_action.php runs the DELETE and the status toggle. Each one uses a MySQLi prepared statement with bound parameters, and the result of each action is shown as a success or error message.

```
$stmt = $conn->prepare('UPDATE students SET status = ? WHERE id = ?');
```

2. Is search by name, e-mail and course implemented?

Yes. When a search term is given, students_list.php adds a WHERE clause using LIKE on fullname, email, student_id and course. The status filter is added the same way, only when the value is active or inactive. All values go in through bind_param(), so the search text never becomes part of the SQL string. The same filters are reused by the CSV export.

```
$stmt = $conn->prepare("SELECT * FROM students $whereSql ORDER BY student_id LIMIT ?
OFFSET ?");
```

3. Are delete operations confirmed before execution?

Yes. The delete form carries a data-confirm message with the student's name, and the list page shows a confirmation dialog before the form is submitted. The confirmation warns that the student's event registrations will also be removed, which matches the ON DELETE CASCADE rule in the schema. As an extension, the "Deactivate" button uses a status column instead of deleting the row, so the record and its history are kept.
