Practical Title: PHP Form Processing with Server-Side Validation and CSV/JSON File Storage

Problem Definition: Process submitted registration/contact form data using PHP. Validate and sanitize inputs on the server side, store the records in CSV file format, and display success/error messages.

Theory :

1. Is the form submitted using POST?

Yes. The form uses method="POST" and action="" so the data is sent to the same page in the request body and not shown in the URL. PHP checks $_SERVER["REQUEST_METHOD"] == "POST" before processing and reads the values from the $_POST array.

2. Are inputs validated and sanitized server side?

Yes. Every value is cleaned with trim(), and then htmlspecialchars() (name, mobile, message) or FILTER_SANITIZE_EMAIL (email) is applied. Validation checks that no field is empty, the name has only letters and spaces (preg_match), the email is valid (FILTER_VALIDATE_EMAIL), and the mobile number has exactly 10 digits (preg_match). Validation runs on the server, so it works even if JavaScript is disabled.

3. Is file writing handled safely?

Yes. The file records.csv is opened in append mode with fopen(), so old records are not overwritten, and the result is checked before writing. fputcsv() writes each record and correctly escapes commas and quotes in the message. The file is closed with fclose(), and "Unable to save data." is shown if it cannot be opened. Data is saved only after all validations pass. File locking with flock() would make it safer for many users.

4. Are success and error responses displayed clearly?

Yes. A green message "Registration submitted successfully." is shown after saving and the form is cleared. A red message is shown for each problem, such as "All fields are required.", "Invalid email address.", or "Mobile number must contain 10 digits.". On an error, the entered values stay in the form so the user does not retype everything.

Implementation/ Output/Result

records.csv

```
"Brind Rachhadiya",rachhadiyabrind@gmail.com,9876543210,"This is a test
message.","2026-10-12 11:58:21"
"Krisha Shah",krisha@example.com,9123456780,"Second record, with comma.","2026-10-12
11:58:21"
```

7

Figure: (1) empty form, (2) all fields required error, (3) invalid name, (4) invalid email, (5) invalid mobile number, (6) successful submission, (7) records saved in records.csv.

Learning Outcomes:

- Process HTML form data using PHP and the POST method
- Validate user input on the server side
- Sanitize input to prevent unsafe data and XSS
- Store form records in a CSV file using file handling
- Display clear success and error messages
- Understand safe file writing practices in PHP
